insti. (dir.- kandidat meditsinskikh nauk V. F Chernyshov, zam. direktora

Abstract: Observations on 102 patients treated by chemical
preparations showed that resistant strains of
tubercle bacilli (TB) were liberated chiefly by
patients with extended fibrous-cavernous lung
tuberculosis, with express manifestations of emac-
iation, intoxication and lung-heart deficiency; a
combined antibacterial therapy was ineffective or
the effect was short-lived and insufficient in

TITLE: Cerebellar reaction to afferent stimulation during accelerations [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24 to 27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 205-206

TOPIC TAGS: space physiology, biologic acceleration effect, central nervous system, electroencephalography, cerebellum, rat

ABSTRACT: The stabilizing function of the cerebellum depends on the qualitative and quantitative nature of afferent impulsion and the ability of neuron systems to adequately digest incoming information. One approach to the study of this problem is to evaluate the reaction of the cerebellum to ordinary afferent signals.

An evoked potential method was used in the study. Tests were conducted on white rats exposed to transverse accelerations (10 G for 4 min). The evoked potentials were responses to individual stimuli administered to the sciatic nerve. Square pulses with a duration of 0.5 msec were administered via a steel needle through the bone of the Culmen monticuli area. Potentials were recorded before, during, and after acceleration by means of a "Disa" universal gauge and a preamplifier on an "Alvar" electroencephalograph.

Electrical responses to sciatic nerve stimuli were recorded in rats
Card 1/2

L 10964-67
ACC NR: AT6036581

anesthetized with nembutal. These responses took the form of two-phased, negative-positive oscillations with latent periods of 25.2 ± 1.4 msec. Occasionally, spike discharges were recorded before the negative phase or during its descending phase.

Accelerations caused changes in the amplitude and form of the evoked potential both during and up to 10 minutes after exposure. These changes were reflected in a decrease in response to threshold stimulus, a decrease in the amplitude of the negative phase up to its complete disappearance, and intensified spike discharges. From the data it can be seen that acceleration (10 G), which is well tolerated by rats and does not affect their general condition, causes substantial changes in the function of cerebellar afferent systems. The logical conclusion might be that during the action of spaceflight factors, transition to weightlessness is accompanied by a disruption of adequate perception of afferent impulses by the cerebellar cortex. This could be of considerable concern relative to the disruption of cerebellar mechanisms. [W.A. No. 22; ATD Report 66-116]

TITLE: Changes in myocardial bioelectric activity in healthy and sick persons, based on data of vectorometric analysis of electrocardiograms taken during excess pressure oxygen breathing [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24-27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 309-310

TOPIC TAGS: hyperoxia, electrocardiography, cardiovascular system, oxygen excess pressure

ABSTRACT:

Excess pressure (200 mm H₂O) oxygen breathing for 10 min was used to place a dosed load on the "right heart" of 96 flight personnel aged 25 to 40 (20 normals, 30 with impaired cardiac excitation and conduction functions, 34 with various myocardial dystrophies, and 12 with atherosclerotic hypertension. Before and during the experiment (5th through 7th minutes of loading) EKG's were recorded with 15 leads; 3 standard and 3 amplified

Card 1/3

ACC NR: AT6036619

monopolar leads on the extremities, for constructing cardiac vectors in the frontal plane, 6 chest leads for the horizontal plane, and three Arrici leads for the sagittal plane.

All data with a statistical reliability < 95% were excluded. In healthy persons, loading evoked an adequate reaction consisting of a simultaneous right shift of all (particularly frontal) cardiac vectors. The well-known impairment of ventricular myocardium (repolarization) was reflected in simultaneously decreased magnitude of AT vectors and ventricular gradient in both planes.

Changes in myocardial biocurrents were more pronounced in the presence of cardiovascular diseases. In persons with disturbed cardiac rhythm and impaired myocardial conductivity, similar but greater shifts occurred in the above vectors. Persons with myocardial dystrophy also showed right precordial strain not proportional to the amount of increase in intrapulmonary pressure, manifested as an abrupt shift to the right and back and an increase in the magnitude of the AT vector. In incipient atherosclerotic hypertension, cardiac vector changes are no longer limited to simple positional shifts, though these do occur; the AQRS vector change is different from the AT vector changes; frontal plane vector changes are

Card 2/3

ACC NR: AT6036619

inversions of changes in the sagittal plane changes. When the AQRS vector suddenly increases and shifts to the right, the AT vector tends to shift to the left. These changes in their totality indicate considerable overloading of the right heart, particularly the right ventricle.

*4078. Failures in the diagnosis of cancer of the stomach (Russian text)
POLESHCHUK I. S. District Oncol. Dispens., Vladimir *Vopr. Onkol.* 1959, 5/7 (97-100)
This is an analysis of 1,266 cases of far-advanced gastric cancer observed during
1952-1957. Within 1 month from the onset of the symptoms 40.3% of the patients
came to the doctor, within 2 months 13.7%, within 3 months 10.6%; all others came
later than 3 months. At the 1st roentgenological examination the diagnosis was made
in 40.6% of cases, at the 2nd in 22.3%, at the 3rd in 9.5%, and at the 4th in 5.4%
of cases. The causes of late diagnosis are: faulty diagnosis (21.8%), silent course of
the disease (23.4%), patient's delay (17.4%), long-lasting examination (17.6%),
and other causes (19.8%).

ABSTRACT: The design of a vibrational continuous centrifuge used for dewatering of coal fines in which the discharge of the solid phase is caused by specially arranged axial vibrations of the rotor is described. The centrifuge is made by Kleckner-Humbold. This type of centrifuge is considerably more efficient than the inertion type; a comparison is given in the Table.
There is one table and one figure.

TITLE: Small Multi purpose High-Speed Centrifuge MG-350 (MG-350)

PERIODICAL: Khimicheskoye mashinostroyeniye, 1960, No. 5, pp. 6 - 7

TEXT: The NIIKhIMMASH (All-Union Designing and Scientific Research Institute for Chemical Machinery) developed a horizontal high-speed MG-350 centrifuge with filtering and separating rotors. The body is cast-iron made, the inside surface is lined with 1X18H9T (1Kh18N9T) stainless steel. It is planned to improve the operation of the centrifuge by the installation of an electric motor with infinitely variable revolutions. Estimated maximum capacity of the centrifuge is 700 l/h of liquid phase, rendering it suitable for laboratory and similar experiments. Technical characteristics are: diameter of the rotor 350 mm, length 160 mm, capacity 8 l; 1,750, 2,500, 3,200, 4,000 rpm. Separation factor at stated rotation speeds: 600, 1,200, 2,000 and 3,100; size: 990 x 640 x 660 mm; weight 325 kg and oil pump capacity 4 l/min. The rotor is equipped with an A051-4 (A051-4) motor of 4.5 kw and the oil pump with a 120 w AOL-11-4 (AOL-11-4) engine. There are 2 figures.

TITLE: Further development of the otolithic theory of motion sickness [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24 to 27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 216-217

TOPIC TAGS: biologic acceleration effect, motion sickness, coriolis acceleration, vestibular analyzer, unconditioned reflex, visual analyzer, central nervous system

ABSTRACT: The otolithic theory of motion sickness (V. I. Voyachek, 1909-1958) is widely recognized. Its basic assumptions are: 1) the universal nature of motion sickness (it can arise during any kind of motion); 2) the summation of reactions (cumulation) as a mechanism of the development of motion sickness; 3) the vestibular, proprioceptive, visual, and cutaneous mechanical receptors participate in the reflex mechanism of motion sickness development during which, the otolithic component of the vestibular analyzer assumes the basic role; 4) the most essential cause of motion sickness is vertical displacements of the human body which address otolithic receptors; 5) the conditioned reflex mechanism of motion sickness is supplementary; 6) the condition of the nervous system plays an important role in the development of motion sickness; 7) various external conditions (high air temperature, smells, etc.) influence the development of motion sickness; 8)

Card 1/2

L 10971-67

ACC NR: AT6036588

the resistance of the organism to motion sickness can be built up by repeated exposure to its causative mechanisms (training).

The investigation by the authors led to the establishment of the following: 1) the existence of a phase in the development of motion sickness; 2) a functional fluctuation, the amplitude of which changes as a function of the developmental phase of this condition; 3) an additional mechanism of motion sickness (disrupted systemic function); 4) the development of rocking illusions accompanied by compensatory motor reactions; 5) peculiarities of the course of motion sickness at altitudes of 2000, 3000, 4000, and 5000 m ("elevation" in a pressure chamber); 6) shifts in the excitability and lability of the visual analyzer in the latent form of motion sickness; 7) shifts in atrioventricular conductivity during various phases of motion sickness; 8) the influence of dibasol on the course of the latent form of motion sickness; 9) the inhibition of lifting reflexes (according to EMG data) during the prolonged, standard oscillation of experimental animals and the development of these reactions when the oscillation regimen is altered; and finally, the prospect of applying motion sickness to the discovery of functional insufficiencies, e.g., using conditioned reflex models of motion sickness to reveal statokinetic defects in human subjects. Title : On As⁷⁶ Emission.

Orig Pub : Vestn. Leningr. unta, 1957, No 10, 37-39

Abstract : β and γ -emissions of As⁷⁶ with T/1/2 = 26.75 hours are studied. The β -spectram was studied with a β -spectrometer with double focussing. The γ -emission of As⁷⁶ was measured with a magnetic spectrometer for measuring the hard γ -emission by recoil electrons. 5 β -lines and 6 γ -lines were revealed, their E is as follows: 350 ± 30 , 880 ± 100 , 1760 ± 40 , 2410 ± 30 , 2960 ± 20 kev and 1.21 ± 0.02 , 1.43 ± 0.03 , 1.77 ± 0.04 , 2.10 ± 0.03 , 2.42 ± 0.04 Mev correspondingly.

TITLE: Radioactivation analysis of high-purity aluminum

SOURCE: Vsesoyuznoye koordinatsionnoye soveshchaniye po aktivatsionnomu analizu,
1st, Tashkent, 1962. Trudy. Tashkent, Izd-vo Nauka UzSSR, 1964, 40-44

TOPIC TAGS: activation analysis, aluminum analysis, neutron bombardment, gamma spectrometer, radioisotope separation

ABSTRACT: A method was developed for determining copper, manganese, zinc, gallium, cadmium, iron, and gold in high-purity aluminum. It consists of irradiating aluminum together with standards for the impurities with a flux of 10^{12} - 10^{13} neutrons/cm 2 . sec. for 20-30 hrs, and the radiometric measurement of the γ radiation from the corresponding isotopes by means of a scintillation counter (NaI(Tl) crystal and FEU-29 photomultiplier). Following irradiation, the isotopes Cu²⁴, Ga⁷², Fe⁵⁹, and Mn⁵⁶ are separated radiochemically, and Zn⁶⁹, Cd¹¹⁷, Cd¹¹⁵, and Au¹⁹⁸ are separated chromatographically. The sensitivity of the determination of some impurities is as follows: copper, $1 \times 10^{-7}\%$; manganese, $1 \times 10^{-6}\%$; iron, $1 \times 10^{-5}\%$; zinc, $1 \times 10^{-4}\%$; gallium, $1 \times 10^{-3}\%$; cadmium, $1 \times 10^{-2}\%$.

TITLE: Methods for the study of attractants

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 8, 1965, 18-22

TOPIC TAGS: insect control, insecticide

ABSTRACT: Investigation of insect attractants and traps acquires increasing importance in connection with the development by insects of tolerance to insecticides. Furthermore, by using specific attractants spreading of poisonous chemicals over large areas can be avoided and damage to useful insects prevented. Traps of the type proposed by J. T. Whitlaw and L. W. Smith, Jr., J. Econ. Entomol. 57, 164, 1964, proved to be effective for cockroaches. In tests with these traps conducted to establish the effectiveness of attractants for red cockroaches (*Blattella germanica* L.), pyridine attracted the greatest number of these insects. Its effectiveness was 190-95% as compared with 49% for glycine, 14% for acetoacetic ester, 6% for butylacetanilide, and 5% for diethylaniline. Furfural and acetanilide proved to be repellents. Tests on the Central Asian cockroaches *Shelfordella*

tartara established that baits consisting of foodstuffs were ineffective in attracting imago or acted as repellents (with the exception of sour milk, which attracted males), while nymphs were attracted by some foodstuffs. In tests on flies glass beakers with wire mesh funnels inserted on top were used as traps. By using traps of this type with a height of the beakers ranging from 6 to 17 cm. and placing rye bran moistened with a 10% saccharose solution containing chlorophos at the bottom of the beakers, it was established that house flies were attracted by the bait at distances = 12 cm. The relative effectiveness of attractants for flies (*M. domestica*, *F. canicularis*, *L. sericata*, *M. stabulans*, *Drosophila* sp., *Sarcophaga* sp) was investigated by placing traps containing the attractants in the windows of pigsties. The most effective attractant for all species was a 20% solution of isobutyraldehyde in alcohol, followed by a 10% solution of acetanilide in alcohol, a 5% solution of phenylurea in alcohol, a 20% solution of phenylacetic acid in alcohol, and a 20% solution of capric acid in alcohol. The effect of the attractants on the flies varied from species to species. V. V. Kulanin participated in the research by carrying out work in Kara-Kalpakskaya ASSR. Orig. art. has: 1 figure and 2 tables. [JPRS]
